

Sept 12, 130hz, left side goal

Dr. Strange - Up and out, makes a circle in front of the entrance then heads toward the fork a little. Then goes back and forth, then gets toward the fork and looks about, then sticks eir head in the wrong side. E is starting to go in at the 10 minute mark. And then I realize my data has been fucked for this go as the cap on the wrong side had mostly fallen out, having allowed fresh air to go in. I'm relieved that the next experiment will not have these issues. I remove em from the maze, weigh em and set em loose in the terrarium.

2.1g

Trails - I make sure the cap is fully secure so it will not fall out. Trails goes up and out of the entrance cap, starts out the maze slightly on the wrong side, but gets to the fork looking into the correct side. Then, e goes and sticks eir head into the correct side. E pulls it out and looks in the wrong side then eventually sticks eir head in the wrong side (I check the cap really quick - it's fine). E goes into the wrong side and down and goes in cap and then the 10 min are up. I pull em out at the entrance and set em loose in the terrarium after weighing em.

2.89g.

Isabella - E goes in and up and heads toward the fork. E goes straight down to the fork and ends on the correct side, looking into the fork. After a few minutes, she millimeters into the fork on the correct side and peaks eir head in, but does not fully enter the correct side. E turns around and heads back toward the entrance and eir head is in the entrance when the ten minutes is up. I open it, weight her, and set em loose in the terrarium. 2.99g

Big Yellow - Goes in and up and straight toward the fork, looking back and forth into the sides. E moves forward into the fork, one eye in each side. E sticks eir head into the wrong side and goes in. E goes all the way to and in the cap of the wrong side. Then, e left the cap and heads back to the fork, then to the entrance. At the ten minutes, I take em out, weight em, then set em loose in the terrarium. 2.86g.
